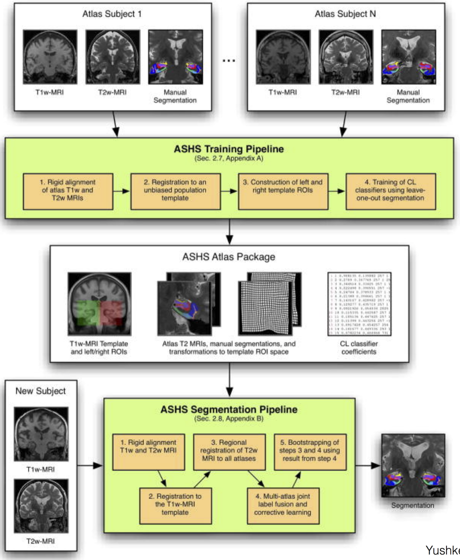
Motivation

ASHS overview



Training steps

1. atlas registration
2. joint label fusion
3. AdaBoost training

Segmentation steps

1. atlas registration
2. joint label fusion
3. corrective learning
4. repeat 1*, 2, 3
5. heuristics

Yushkevich et al., Human Brain Mapping, 36:258-287, 2015.

Joint Label Fusion

Modifications

- Registration
  - `ANTS` → `antsRegistration`
  - B-spline SyN ("`-t BSplineSyN[...]`")
  - `WarpImageMultiTransform` → `antsApplyTransforms`
  - generic label interpolation ("`-n GenericLabel[Linear]`")
- `jointfusion` → `antsJointFusion`
  - non-negative least squares option (vs. SVD)
  - multi-threaded
  - memory issues
  - joint intensity fusion

Registration — beyond original SyN

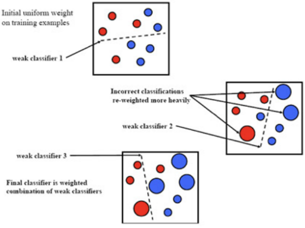
Corrective learning

Modifications

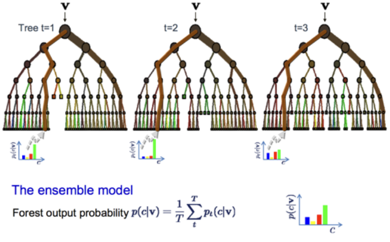
- machine learning technique
  - AdaBoost (original ASHS)
  - random forests
  - extreme gradient boosting
- ANTsR implementation
  - open-source
  - easy to change machine learning techniques
- prior knowledge
  - two classes (original ASHS)
  - four classes

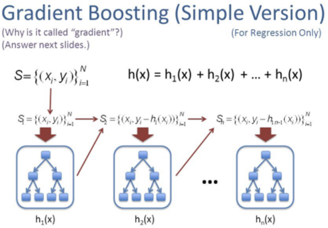
Machine learning techniques

- AdaBoost
- Random forests
- Extreme gradient boosting
- Support vector machines
- etc.



$$H(x) = sign(\alpha_1 h_1(x) + \alpha_2 h_2(x) + \alpha_3 h_3(x))$$





ANTsR facilitates technique substitution

  modelXgb <- xgboost::xgb.train( paramXgb, modelDataPerLabelXgb, nrounds = 2, nthread = 2, verbose = 0 )

  labelModels[[l]] <- modelXgb
```

Data overview

- Penn data
  - Yushkevich et al., Hum Brain Mapp. 2015 Jan; 36(1): 258–287.
  - 29 subjects
  - 10 labels per hemisphere (2 are discarded prior to analysis)
  - hippocampal subfields and extrahippocampal cortical structures (ERC/PRC/PHC)
- UCI Data (“Stark Training Set”)
  - 19 subjects
  - 3 labels per hemisphere
